

BriefWise via Gemini Flash - Local Integration, Reliability, and Governance Report

September 20, 2026 | Public engineering assessment | Not a production-readiness certification

1. Executive Summary

BriefWise is functioning locally as a governed Gemini-based legal-workspace application. Gemini Flash generates ordinary responses, while BriefWise supplies routing, workspace context, diagnostics, and server-side governance boundaries.

The integration has been exercised across ordinary chat, supplied-only prompts, and retrieval-enabled workflows. Testing showed that the application can preserve source uncertainty, distinguish candidate language from verified legal work product, and keep verification, FilingReady, and export decisions outside the model.

This does not establish production readiness. PostgreSQL/Matter persistence and complete end-to-end controlled-output activation remain unconfirmed.

2. System Identity and Current Configuration

Item	Confirmed state
Application	BriefWise / Law Local
Provider	Google Gemini
Model	gemini-3.8-flash
Runtime	BW_RUNTIME_T18_0_166_v1
Output ceiling	10,000 tokens
Ordinary chat	Operational in tested local environment
Supplied-only routing	Operational when explicitly requested
Live retrieval	Available in tested path when explicitly required
Gemini output	Probabilistic engine; DI2-governed
Production readiness	Not established

3. What BriefWise Adds Around Gemini

BriefWise provides the application and governance layer surrounding Gemini. Confirmed or designated responsibilities include:

- Conversation and matter workspace handling.
- Selection between supplied-only and retrieval-enabled routes.
- Safe provider diagnostics.

- Evidence and authority mapping.
- Validation and review controls.
- Replay and export controls.
- Server-computed FilingReady status.

Gemini remains the language-generation component. It does not independently control verification, authorization, source provenance, human approval, replay, export, or FilingReady status.

4. Confirmed Working Capabilities

The following capabilities have been observed or supplied as confirmed:

- Ordinary /api/chat responses complete.
- Gemini Flash is reachable through the local BriefWise gateway.
- Google Search grounding is available for prompts that explicitly require live retrieval.
- Explicit supplied-only prompts can use route:none.
- The final source-integrity challenge completed without external sources.
- The final challenge correctly preserved unresolved, incomplete, unverified, and jurisdiction-mismatch states.
- No API key or sensitive diagnostic data was exposed in the tested output.

5. Evaluation Scope and Operational Boundaries

Testing covered record fidelity, contradiction and timeline handling, instruction separation, source-integrity behavior, and route selection across supplied-only and retrieval-enabled workflows.

The results support continued engineering and synthetic testing. They do not establish that every prompt will be routed correctly, that every authority is verified, or that any generated output is FilingReady.

The report therefore separates model generation from application controls. Provider output, supplied metadata, and route selection are treated as inputs to validation—not as proof of legal authority, authorization, persistence, or release readiness.

6. Challenge-Test Results

Test	Result	Route	Retrieval status	Assessment
Record-fidelity challenge	Passed	Supplied-only	None	Strong record-bound behavior
Contradiction/timeline challenge	Passed	Supplied-only	None	Preserved conflicts and uncertainty
Instruction-separation challenge	Passed	Supplied-only	None	Followed output constraints
Source-integrity challenge	Passed	route:none	None	Preserved unresolved and unverified states
Routing behavior	Partial	Mixed	Conditional	Continued coverage testing warranted
Final source-integrity challenge	Passed	route:none	None	9 of 10 criteria met; authority verification remained outside the supplied-only scope

The challenge results do not prove legal authorities. They demonstrate that the application can preserve source uncertainty and avoid treating supplied metadata as verified authority. The reported approximately 9/10 assessment means 9 of 10 evaluated challenge criteria passed; the remaining limitation was the deliberate absence of independent authority verification on the supplied-only route.

7. Route Selection and Retrieval Behavior

The intended routing distinction is:

- route:none: use supplied materials only for substantive facts and authorities. Model memory is not evidence, and no external retrieval is performed.
- route:web: use live retrieval when the user explicitly requires external research.

The routing policy is designed to recognize explicit supplied-only instructions. Terminology referring to search, grounding, or live retrieval can still require careful prompt classification, so broader route-coverage testing remains appropriate.

8. Governance and Deterministic Control Boundaries

The governance model is server-controlled:

- Gemini proposes language and analysis.
- BriefWise must validate structure and evidence relationships.
- Authority verification must be performed through the controlled workflow.
- FilingReady status must be computed by server-side gates.
- Human review remains separate from model generation.
- Replay and export status must not be asserted by Gemini.

"Deterministic" describes the control and validation layer, not the underlying Gemini generation process.

9. What Gemini Does Not Control

Gemini does not control or establish:

- Whether a citation is legally verified.
- Whether a proposition is supported by an authority.
- Whether a fact is supported by the record.
- Whether an output is FilingReady.
- Whether a user is authorized to release work product.
- Whether human review occurred.
- Whether a replay or export is valid.
- Whether persistence succeeded.

Any provider claim about these states remains subject to BriefWise validation and governance.

10. Persistence and Production-Readiness Limitations

PostgreSQL/Matter persistence has not been independently confirmed as available and durable for the full controlled-output lifecycle.

Accordingly, the following cannot be claimed:

- Durable matter persistence.
- Complete controlled-audit activation.
- Production-grade replay.
- Durable review-packet storage.
- Production FilingReady export.
- Full end-to-end production readiness.

The local application can demonstrate provider interaction and routing behavior without establishing durable legal-work-product storage.

Overall conclusion

A promising, partially functioning local integration suitable for continued engineering and synthetic testing. Production readiness is not established.

11. Risk Register

Risk	Status	Impact
Probabilistic Gemini output	Confirmed	Requires validation and human review
Route-classification coverage	Under evaluation	Requires broader route testing
Missing or unconfirmed persistence	Unresolved	Prevents production-readiness claim
Provider-supplied status claims	Must be rejected or ignored	Prevents false authority
Unverified legal authorities	Ongoing risk	Requires source-level verification
Long prompts and token exhaustion	Not fully characterized	May produce incomplete output
Search-grounding availability	Conditional	Depends on route and returned sources

12. Recommended Next Steps

1. Expand synthetic route tests for prompts mentioning search or grounding but expressly prohibiting external retrieval.
2. Add a dedicated report mode that defaults to supplied-only routing unless live research is explicitly requested.
3. Confirm PostgreSQL/Matter connectivity and durable controlled-output persistence.
4. Exercise the complete generate -> validate -> review lifecycle with synthetic data.
5. Keep FilingReady, verification, replay, authorization, and export decisions server-controlled.
6. Continue treating Gemini as the probabilistic generation engine operating within the BriefWise DI2 validation and governance harness.

13. Final Status Table

Area	Status
Local Gemini connection	PASS
Ordinary BriefWise chat	PASS
Supplied-only source-integrity challenge	PASS
Retrieval routing	PARTIAL - broader coverage testing remains
Safe diagnostics	PASS in tested path
Server governance boundary	Designated and partially exercised
Durable Matter persistence	UNKNOWN
Full controlled audit lifecycle	UNKNOWN
Production readiness	NOT ESTABLISHED
FilingReady legal output	NOT ESTABLISHED
